Questions for A2B Displaying Values on LEDs Video (Hand-in sheet via Brightspace)

Name: 041153940

Student Number: PATEL VASUKUMAR

After including your Name and Student Number above, complete the following questions **in your own handwriting** (please print) and either scan your answers or submit a legible picture(s) of your solution within a MSWord or Adobe document. If your name and Student Number are not included, or your handwriting is illegible or your answers are typed, your submission may not be assessed.

Each question is worth one mark.

Questions	Answers
1. How many individual LEDs are on the Dragon12 Plus hardware board? Does the Dragon12 Simulator support all of these individual LEDs?	-> 8 LED's -> YES it supports all.
2. Which port on the Dragon12 Plus hardware board is used to display data on the LEDs.	PB7
3. Write the one line of code that must be included at the top of an Assembly Language program that will uses the Input/Output (I/O) registers, such as the LEDs?	#include C:\68HCS12\registers.inc
4. PortB is a bi-directional register. What is the name of the I/O register that must be configured to make PortB an output?	DDRB
5. Why must the seven-segment LED displays be turned off to avoid hardware conflicts with the individual LEDs?	because they are the same configuration (port)
6. Why are the labels PB7ON an PB7OFF capitalized?	because they are constants
7. Write the line of code that causes the program flow to execute the code in subroutine Config_SWs_and_LEDs?	jsr config_SWS_and_LEDS
8. What instruction is used at the end of every subroutine to return program control to the calling file (e.g. the code that called the subroutine)?	rts ; return from sub-routine)
9. What register holds the delay value for subroutine Delay_ms?	Accumulator A
10. Write the lines of code that would cause a delay of 500 ms after displaying a value on PORTB, but do not use iteration in your solution.	staa portb ldaa #250 jsr Delay_ms jsr Delay_ms rts
